

Rennicks Virtual Journey Time System

Perfect for incident management, events and large infrastructure schemes, the RVJTS enables you to:

- Manage, monitor and ease congestion to influence driver behaviour
- Help maximise network resilience planning and response
- Improve road worker and driver safety
- Save time and reduce costs
- Provide a more sustainable solution

A first of its kind solution to the issue of journey time

Technology for Smarter Highways

The Rennicks Virtual Journey Time System (RVJTS) is a first of its kind solution to the issue of journey time. RVJTS is live, flexible and reactive and perfect for incident management, events and large infrastructure schemes. By eliminating the need for hardware, deployment costs are saved, delays in procurement are reduced and there is no risk to road worker safety.

“The system is a great tool for reassuring the road user their journey may not be as disrupted as first perceived. We are able to display accurate and reliable journey times for our diversion routes and find the time displayed on the sign provides important road user information when operating our overnight road closure programme.”

Manchester Smart Motorways

“With the Rennicks Virtual Journey Time System we’ve been able to provide drivers with live times for diversions using remote data, so there’s no need for equipment along the diversion route.”

Highways England

“The concept of the Rennicks Virtual Journey Time System proved to be invaluable during the A22 London Road temporary road closure. Using the system, we were able to monitor a very busy strategic route without the need for the installation of hardware. An added benefit was having the capability to update the travelling public remotely. The live data also enabled the phasing of the traffic lights to be altered during peak hours.”

Jacobs

Clear and accurate information, presented to drivers in a timely manner, will improve the overall network experience for motorists.
